oAn (n, k) linear code C is called a cyclic code if every cyclic shift of a code vector in C is also a code vector oCodewords can be represented as polynomials of degree n. For a cyclic code all codewords are multiple of some polynomial g(X) modulo Xⁿ+1 such that g(X) divides Xⁿ+1. g(X) is called the generator polynomial. Examples:

This book owes its beginnings to the pioneering work of Claude Shannon in 1948 on reliable communication over noisy transmission channels. Shannon's central theme was that if the signaling rate of the system is less than the channel capacity, reliable communication can be achieved if one chooses proper encoding and decoding techniques.

The 4B/5B block coding discussed in Chapter 4 is a good example of this type of coding. In this coding scheme, k=4andn=5.Aswesaw,wehave2k = 16 datawords and 2n =32coddewords. We saw that 16 out of 32 codewords are used for message transfer and the rest are eiither used for other purposes or unused. 10.15

This thesis deals with the design of error-control coding schemes for three different problems of noisy information transmission, storage and processing. These problems have in common that they are of interest from a practical, industrial point of view and that they cannot be solved elegantly by traditional error-control coding schemes.

This is a well written book on the introduction to error control coding. Although now a little bit outdated (lack of all the new development of the 1990's and 2000's, e.g. Turbo code, LDPC code, etc.), it is a good introductory book such that students can build up their foundation for futher venture to the error control techniques.
